Agellis receives an order for 70 KEuro from a North American steel plant

AGELLIS Group, which develops and sells products and solutions to the global metals industry, has received one order totaling 70 KEuro for measurement systems from a North American steel plant.

The order, which consists of an upgrade of two systems for level measurement in continuous casting molds (EMLI-M), are expected to be delivered and installed during the third quarter of 2012.

To achieve high quality when casting steel, level measurement of the molten steel in the mold is a very important process parameter. The Agellis EMLI-M measures the level of molten steel with high accuracy and reliability during casting.

"The customer has been using an earlier version of the EMLI-M system for many years and it's a good sign of our product reliability that they choose to upgrade their systems. The order has a great reference value for Agellis in the North American market" says Patrik Bloemer, CEO of Agellis.

For competitive reasons, Agellis chooses not to mention the end user plant by name.

All Agellis products are based on a common platform, namely the EMLI system electronics. The EMLI-M measures molten steel with high precision in the mould during casting. The sensor is very close to the steel and must therefore meet very high survival and environmental standards. Good level measurement of the molten steel in the mould is a prerequisite for a smooth, high quality steel production.
