

Quantros Announces Patent Pending for Industry First, Dynamic Safety Event Reporting Technology

Intelligent Engine Automatically Classifies Events, Saving Time and Increasing Accuracy for Healthcare Safety and Quality Reporting

MILPITAS, Calif., June 26, 2013 -- [Quantros](#), a leading provider of quality, safety and clinical business intelligence solutions for the healthcare industry, announced the patent pending status for its proprietary Smart Classification™ technology, a clinically intuitive technology for healthcare organizations to more quickly and precisely classify incident reports in real-time. Smart Classification is embedded intelligence that returns suggested classification as the user is in the process of entering the event into the Quantros system. This cutting-edge technology drives event classification accuracy and consistency that has not existed before, saving time for end users and opening up reporting access to more levels within an organization.

“As a company, we are constantly looking at our solutions from the perspective of our end users, adapting our product to reduce their time spent reporting, so caregivers can spend more time with patients. This technology simplifies event reporting and classification in a way that eases the burden for staff and the healthcare organization as a whole,” said President and CEO Keith Hagen. “Smart Classification is an innovative step toward truly accurate safety and quality data capture, which will immensely impact the efficacy of performance improvement initiatives.”

Smart Classification will be built into Quantros largest product suite, [Safety Event Manager](#) (SEM), which is the core application of the powerful event reporting solution, [Safety and Risk Manager](#) (SRM). Because Quantros applications are SaaS-based, updates and new capabilities will automatically be pushed out to customers upon the completion of development.
