

Mycronic receives order for an advanced mask writer and a measurement system

Mycronic AB (publ) has received an order for a Precision 800 Evo mask writer for display applications and a Precision MMS measurement system for quality assurance of advanced photomasks. The order has been received from an existing customer in Asia and is valued between USD 43 and 48 million. Delivery of the Precision 800 Evo is scheduled for the third quarter of 2020 and the Precision MMS for the second quarter of 2021.

Mycronic offers mask writers for the manufacture of photomasks within different areas of application. These are display manufacturing (TV, smartphones and tablets) and applications within multi-purpose, a broad segment comprising many different application areas. In addition, Mycronic recently launched SLX, a new laser mask writer for the semiconductor industry.

A fully equipped Precision 800 Evo can, while maintaining productivity, produce patterns that are almost 25 percent more compact than previously possible. This ensures efficient production of the most advanced and critical photomasks for AMOLED displays for smartphones and tablets.

Precision MMS is the most advanced metrology system in the market, used to assure the quality of the photomasks in terms of pattern positioning. By combining Precision 800 Evo with Precision MMS the performance can be leveraged, which is especially important for AMOLED displays since the requirements on the mask are tighter compared with LCD displays.

"It is gratifying to receive the third order for a Precision 800 Evo, Mycronic's most advanced mask writer, together with an order for a Precision MMS. This gives the customer access to the combination of Precision writer and Precision metrology system which has become industry standard for producing the most advanced photomasks", says Charlott Samuelsson, Sr VP Pattern Generators at Mycronic.
