Novel HoloMonitor-based research to be presented at cancer research annual meeting

The research results by three research groups at Northeastern University and Lund University will be presented at the [American Association for Cancer Research Annual Meeting](#) in April. Using HoloMonitor® technology from Phase Holographic Imaging (PHI) the scientists have been able to follow and measure important dynamics of cancer cells in ways not possible with conventional methods, which has led to the novel research results. The presentations will be held in connection to PHI's exhibit at the meeting. For additional information regarding the presentations see [here](#).

Phase Holographic Imaging (PHI) leads the ground-breaking development of time-lapse cytometry instrumentation and software. With the first HoloMonitor instrument introduced in 2011, the company today offers a range of products for long-term quantitative analysis of living cell dynamics that circumvent the drawbacks of traditional methods requiring toxic stains. Headquartered in Lund, Sweden, PHI trades through a network of international distributors. Committed to promoting the science and practice of time-lapse cytometry, PHI is actively expanding its customer base and scientific collaborations in cancer research, inflammatory and autoimmune diseases, stem cell biology, gene therapy, regenerative medicine and toxicological studies.
