May 26<sup>th</sup>, 2020

## Increased interest in CariSolv due to the Corona pandemic

One consequence of the Corona pandemic is that the dental industry is facing a major shift in terms of caries treatment. Traditional treatment of caries attacks is done with drilling and repair. In connection with drilling in the tooth, aerosol is formed which radically increases the spread of infection during treatment. The dental industry is now facing a major challenge in how caries should be treated as simply and gently as possible for patient in the future.

RLS Global has, based on the situation, increased demand for CariSolv. CariSolv is based on the same unique buffered hypochlorite technology platform as other products in the portfolio. The gel is applied to the caries and with an instrument, the dentist scrapes away the damaged tissue. In other words, no (or minimal) drilling is required to minimize caries attack and aerosol formation is a very limited problem. RLS has decided to continue the production of CariSolv at least until May 2021. The company has so far received two orders from UK, which will be delivered in July. RLS is also in dialogue with several countries in Europe that have shown interest in the product.

In January, RLS announced that the company had made the strategic decision to focus on wound management and ChloraSolv. As a result, PeriSolv was sold to an external partner, however CariSolv remains in the company's ownership. Important to note – RLS's future strategy and priorities are still wound management and to further develop the unique buffered hypochlorite technology for new indication areas.

*It is satisfying to be able to support the dental industry in these challenging times. CariSolv is a product with good potential, but so far it has not been recognized by the market, says Karin Fischer, CEO RLS Global. Karin continues, 'in the coming months, we will evaluate the future potential of the product and take the long-term decision for the product'.*

### Trading place and Certified Advisor
