Inhalation Sciences signs collaboration agreement with leading Indian multinational pharma company

Inhalation Sciences AB (ISAB) has signed a collaboration agreement with a leading Indian multinational pharma company with a powerful respiratory portfolio and a major presence in over 80 markets worldwide. The company has chosen DissolvIt®, ISAB's *in vitro* dissolution and absorption module, for its Inhalation Research project.

The company is ISAB's first Indian client and is a highly agile, innovative multinational with a large number of development projects ongoing and a YoY R&D investment that has grown continuously over recent years. The Indian pharmaceutical industry as a whole is a major global exporter and one of the largest and fastest growing in the world. Recent increased investment in R&D and innovation from industry and government has been a significant factor in its growth.

In the present collaboration, the company has chosen to use ISAB's research services to assess the dissolution properties of one of their inhalation drugs in their complex generics pipeline with the *in vitro* system DissolvIt®. DissolvIt® is an advanced dissolution method designed specifically for inhaled substances generating data that better correlate with the properties of the same drugs in clinical trials on patients, so potentially reducing risk and costs.

ISAB CEO Manoush Masarrat: "This is an exciting client that adds to our customer list of major pharmaceutical companies in the complex generics area. We are proud to have been chosen by such a prestigious and powerful presence in the global pharma field and look forward to further cooperation".

About Inhalations Sciences Sweden AB (publ)

Inhalation Sciences Sweden AB (publ) develops and commercializes world-leading instruments and services for research into inhalation. The company's patented lab

instruments PreciseInhale® and DissolvIt® enable researchers in the pharma industry to make drug pipeline decisions at an early stage, saving time and resources for R&D departments, and enables researchers in academic institutions to define how aerosols and small particles impact our lungs, and so our health, when being inhaled.
