

## No significant differences in BioGaia's diabetes study

In 2012 BioGaia initiated a double-blind, placebo-controlled study to investigate the effects of *Lactobacillus reuteri* Protectis on blood glucose in type 2 diabetics. Despite positive results from an earlier pilot study no significant differences between the groups were seen in this study.

Forty-five patients with type 2 diabetes were included in the 12-week long study. The analysis of the results will continue to capitalise on as much knowledge as possible.

"There is information in the study that makes us want to go further and analyse if a change in some of the essential parameters in the study or in the study design may be a possible approach for a solution", says Per-Anders Jansson, Associate Professor and Medical Advisor at Gothia Forum, Sahlgrenska University Hospital, Gothenburg.

"Unfortunately we did not see any significant differences between the groups, but given the positive pilot study and the lessons we can draw from the recently completed study, we intend to continue our work to, with the help of a change of the microbiome, achieve improvements for patients with type 2 diabetes", says Peter Rothschild, President BioGaia.

In the 12-week study 45 patients with type 2 diabetes were included. The study was conducted together with Gothia Forum for Clinical Research at the Sahlgrenska University Hospital in Gothenburg in collaboration with Sahlgrenska Center for Cardiovascular and Metabolic Research.
