

## Auslogics Releases Disk Defrag Pro 4.1 with Expanded SSD Options

*Auslogics Software has just released Disk Defrag Pro 4.1 – an updated version of its professional defragmenter with expanded support for solid state drives.*

**Sydney, Australia – October 23rd, 2012** – Auslogics Software Pty. Ltd., a leading publisher of computer maintenance and optimization software has announced the release of version 4.1 of its professional defragmentation software, Disk Defrag Pro.

Auslogics Disk Defrag Professional is a program that offers advanced disk defragmentation and optimization algorithms both to home and business users. Included is the boot-time (offline) defragmentation feature that allows processing of locked system files, as well as 4 data placement optimization algorithms, special modes for SSD's and VSS-enabled drives, an advanced scheduler and extensive graphical charts and reports.

This major update ensures the program will accommodate all points of view toward SSD defragmentation and optimization. For those who are opposed to using defragmenters on solid state drives, the installer now includes options to disable showing SSD drives in the list of disks before the program is used for the first time, so the software never processes SSD's. The added SSD page in program settings, that now combines all previously existing and new SSD-related options, provides expanded configurability for processing SSD drives. A new SSD Optimization profile that has been added in version 4.1 offers special optimization algorithms for dealing with this drive type.

Besides the new SSD options, Disk Defrag Pro 4.1 includes some updates that were implemented as a result of user feedback and requests. The addition of informational notes in the main program window is intended to help new users better understand the program's functionality. The way a user works with defragmentation profiles has been significantly improved, including the addition of a convenient editor for specifying files and folders, which eliminates the need to enter file name and path manually. The section related to junk removal prior to defragmentation has been expanded to include more categories for a more thorough system cleanup. Other changes to the program include improved MFT data display on the drive map, the addition of an automatic check for updates and optimization of all existing defragmentation algorithms.

A free trial download of Auslogics Disk Defrag Pro 4.1 is available from the publisher's website at [www.auslogics.com](http://www.auslogics.com). The program is sold for a price of £18.65 with one license covering up to 3 PC's. The publisher offers promotional discounts through their website, as well as their Facebook page and various software distribution channels.

### **Company background:**

Founded in 2008, Auslogics Software develops a wide range of computer optimization and security tools for personal and business use, including virus and spyware protection, disk cleanup and defragmentation, registry maintenance, Internet speed-up and emergency file recovery.

The company's flagship product, Auslogics BoostSpeed, includes 18 tools designed to speed up Windows-based computers by keeping them running smooth and error-free. The company's business product, Auslogics OnCluster, goes one step further, making maintaining corporate PC network easy and cost-effective.

Software from Auslogics is used by over 10,000,000 people worldwide and is the tool of choice of many IT and computer manufacturing companies, like Sony VAIO, in the US and other countries. Auslogics Disk Defrag was named the best disk defragmentation tool on CNET and other resources.
