Star Vault builds next-generation AI platform with support from AMD

MMORPG-developer and publisher Star Vault AB (publ) ("Star Vault") strengthens its technological position for the next phase of AI-driven game development by building a proprietary AI platform through a collaboration with AMD, which includes the provision of advanced workstation systems and hardware support.

The platform integrates some of the most advanced CPU and GPU technologies on the market to create a powerful hybrid solution for next-generation game development.

Star Vault is developing its own AI platform to accelerate and enhance every aspect of its production pipeline, from content design and simulation to programming, testing and live operations.

The platform is powered by the latest AMD Ryzen™ Threadripper™ 9000 systems, supplied by AMD as part of the collaboration. These systems deliver the performance, reliability and scalability required for advanced AI environments and complex production workflows.

In addition to powering Star Vault's AI infrastructure, the systems equipped with AMD Radeon™ Pro W7900 GPUs are utilized for AI-assisted automation and community interaction. They support real-time tools such as in-game data analysis and the company's AI-driven communication management systems.

This combination of CPU and GPU technologies shortens development cycles, speeds up testing and enables faster delivery of updates to players.

This hybrid infrastructure gives Star Vault access to one of the most powerful AI and development environments in the gaming industry. It combines high computing capacity, energy efficiency and scalability.

Over the past year, the company has evaluated several AI solutions on the market and concluded that off-the-shelf tools are not sufficient for the complex MMO development Star Vault engages in. As a result, the team is developing a proprietary AI infrastructure tailored to handle every stage of production, from design and content creation to programming, testing and live operations.

"We have a unique opportunity to build a proprietary AI platform on top of our long technical history. Through our collaboration with AMD, one of the industry's most respected technology leaders and with their direct hardware support, we are creating a world-class AI and development platform for the future of game creation", says Henrik Nyström, CEO of Star Vault, in a comment.
