

## Projektportalen launches support for MCP - making project data available to AI assistants

Projektportalen, the industry-specific project management platform for the construction trades, is launching support for Model Context Protocol (MCP), enabling customers to securely connect their own AI assistants to their own data within Projektportalen. MCP support is now available as an add-on service and forms the foundation for future AI integrations in the platform.

### **While Others Are Still Evaluating, Projektportalen Has Already Delivered**

While many software vendors are still evaluating how to integrate AI into their products, Projektportalen has already made it a core part of the platform. This is not about individual features – it is about a new way of working.

The industry is changing rapidly, and with it the expectations placed on the tools that support it. Companies in the construction trades are increasingly looking for systems that do not merely store information but actively help them understand and act on it. That is the direction in which Projektportalen is evolving—a company built by people from the industry, with first-hand knowledge of its day-to-day challenges.

### **Ask Your AI Assistant Questions Directly – No Reports or Manual Searches Required**

With MCP support, users can ask questions about their business in natural language:

"Which projects am I working on?"

"What is the financial status of project X?"

"How much have we invoiced this month?"

"Our ambition is to make Projektportalen an AI-native platform without compromising on security or control. Customers should be able to use their own AI tools with their own data while retaining the same permissions they already have in Projektportalen," says Martin Ahlström, Founder and Product Manager at Projektportalen.

### **Secure, Flexible and Ready for the Future**

Security is at the core of the solution. Each user can only access the information they are already authorised to see in Projektportalen. Authentication is handled through OAuth 2.0 and Entra ID, and the feature is enabled through an explicit opt-in for each organisation and user.

Projektportalen is a Swedish B2B SaaS platform for project management in the construction and installation industry. The platform supports project planning, execution and follow-up, including time reporting, change order management, documentation and integrations with accounting systems. Projektportalen helps companies create structure and coordination between site and office. Since summer 2025, Projektportalen has been backed by Monterro, the Nordic region's leading investor in B2B SaaS.
